

You describe which sources and tables to load and how. **Yres generates the Azure Data Factory pipelines, the tables, the history and the monitoring** — and it all runs in your own Azure tenant. No hand-written load scripts, no proprietary runtime: what Yres produces are ordinary Azure components in your own subscription.

WHAT YOU GET

Your sources connected

Dedicated connectors for AFAS and Exact Online. SAP through SAP's own standards, without third-party middleware. Databases, files, Microsoft 365, and any REST or OData API — nested JSON becomes a table by itself.

Change with a safety net

Every edit is recorded as a change and installed per environment, including the Data Factory publish. Changes made directly in the database are audited too.

Your data stays yours

Data, metadata, credentials and secrets live in your Azure tenant, in the region you choose. Secrets in Key Vault, managed identities, web application firewall in every package.

Loading you can rely on

Seven load types, six of which keep full SCD2 history. Change detection on hashes, incremental loading on delta columns, and rollback of a single table to a point in time.

Operations included

Visual master pipelines with Power BI refresh, about eighty health checks, a regression test suite, automatic database scaling around loads, archiving and log retention.

No lock-in by design

Stop using Yres and your environment keeps running. Your own data engineers can keep developing on the structure that is already there.

FIXED, PUBLIC PRICING

Package	Environments	Per month
Essentials	1	€ 350
Advanced	2	€ 674
Ultimate	6	€ 997

No price per user and no consumption charges from Yres. Azure costs are billed in your own subscription; the database only scales up during loads.

WHO IT IS FOR

Mid-market organisations on Azure and Power BI with three or more sources, a small BI team, and figures people have to be able to rely on.

Housing associations

Food & manufacturing

Professional services

Finance

HR

WHY ORGANISATIONS CHOOSE IT

- **An environment in about twenty minutes**, installed automatically in your own tenant.
- **The only tool with its own connectors for both AFAS and Exact Online**, the two most common Dutch ERPs.
- **Full history as standard**, so you can always look back at the state of any given day.
- **Operations ship with the product** instead of being assembled from scripts.
- **A sourced, public comparison** with the alternatives — including where they are stronger.

ON THE ROADMAP

An MCP server for AI assistants and Oracle NetSuite (October 2027), and Microsoft Fabric as a target platform (end of 2027). Organisations starting now do not rebuild later: the model and the configuration carry over.
